The dimensions and technical data listed in this catalogue have been determined with the greatest possible care and the illustrations correspond to the status at the time of printing. However, we reserve the right to make technical changes as well as changes in dimensions, shape and colour.

**Our specifications, in particular the values for possible current loads, are non-binding guide values. The assignment of conductor cross-sections, of current carrying capacities by national or international standards or regulations is neither restricted nor cancelled by this. Only the details and commitments in our order confirmations are binding for us.**

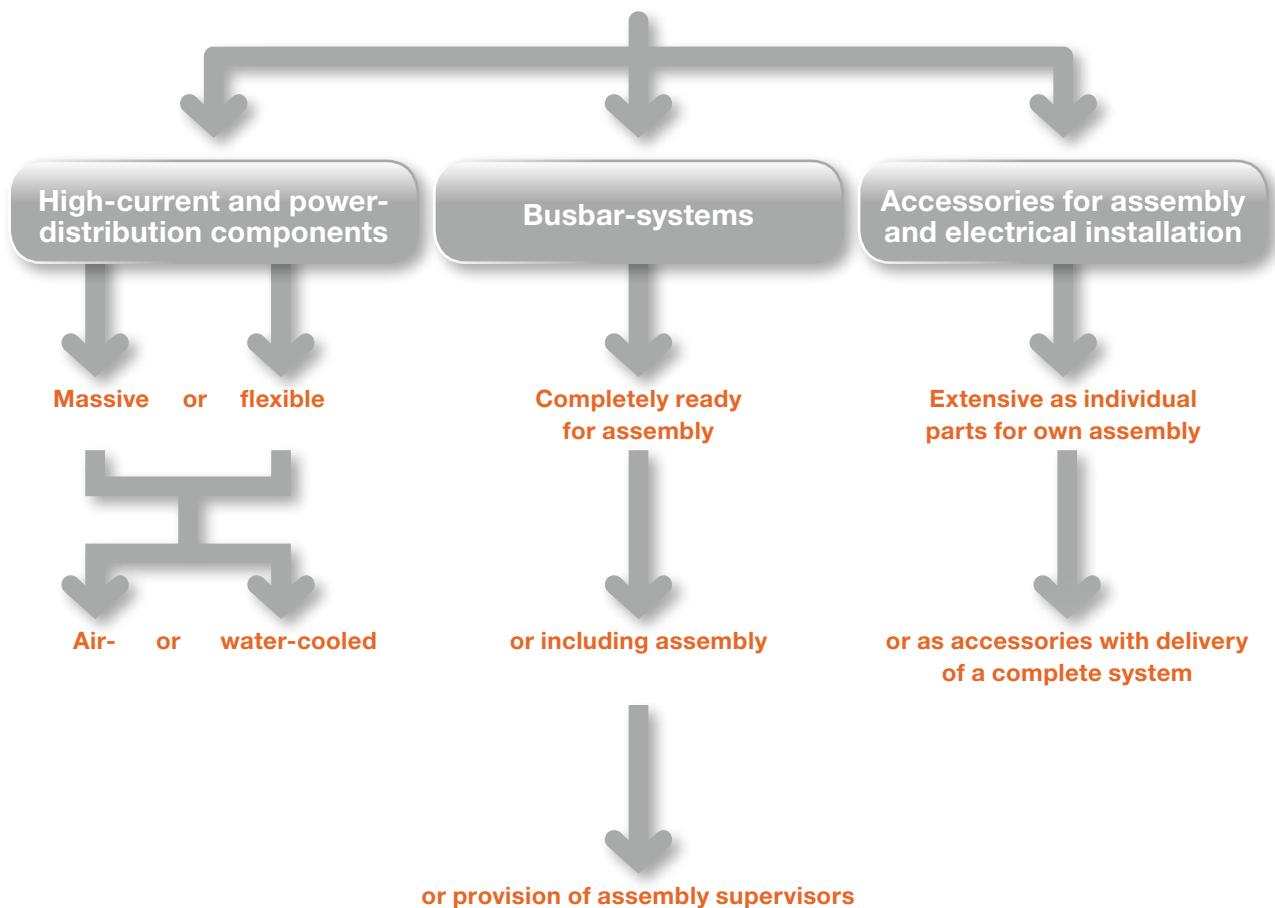

The use of photos, drawings, catalogue pages etc. for own advertising campaigns or other uses requires or formerly written acceptance.

Decades of experience in the field of high-current transmission, electrical installation technology and power distribution enable us to offer a comprehensive range of services from design/engineering to complete components or ready-to-install busbar systems. All from one source. Competent and reliable.

## OUR EXTENSIVE RANGE OF SERVICES

## OUR PRODUCTS

## High Quality and reproducible production processes

Our field of activity is high-current transmission. Therefore currents of several thousands amperes are no problem for us.

We pay attention to first-class quality and have corresponding reproducible manufacturing processes at our disposal.

We are certified according to ISO 9001 2015 and ISO 14001 2015 and maintain a comprehensive quality- and environmental management system.

We design with 3D-CAD-systems and implement our designs in production by using CAM technology.

We are flexible and offer extensive manufacturing options for individual solutions.

We offer comprehensive electrotechnical advice for the construction of new or modernization of older systems.

We design and supply complete busbar systems or individual special solutions according to your wishes.

We guarantee compliance with a high quality standard and fast availability of almost all standard products.

Design reliability through the use of modern CAD/CAM technology

## Careful inspection and control

We have comprehensive testing capabilities. In this way, we create the foundations for our high quality standard.

conductivity test

material testing

hardness test

## Table of contents

<u>Article</u>	<u>Catalogue Page</u>
Range of services for machining solid parts	8-9
Busbar systems	10
Manufacture of complex curved busbars	11
Stamped and punched copper- and aluminium-bars	12
Bent and punched copper- and aluminium-bars	13
Punched or edged sheet metal parts out of copper and bimetallic materials	14
Bimetallic sheets and washers	15
Welded and soldered copper- and aluminium components	16
Milled and turned components made of non-ferrous metals	17
Perforated and unperforated busbars according to customer requirements	18/19
Earth and potential equalization bars	20/21
Busbar supports	22/23
Busbar holders	24-27
Standoff insulators	28-30
Flexible high-current connectors	31-33
Highly flexible high-current connectors made out of flat braid	34/35
Highly flexible high-current connectors made out of round stranded copper cables	36/37
Flexible expansion connectors made out of copper and aluminium strips	38/39
Insulated supply bars	40-42
Screw material	43/44
Technical appendix/tables short circuit values/support distances	45/46

## High current and power distribution components as well as accessories for assembly and electrical installation

We manufacture and deliver high current components and accessories for various kinds of branches and application.

- Busbars and busbar components
- Earth and neutral busbars
- Stamped and punched copper- and aluminium parts according to your samples and drawings
- Punched and bent sheets
- Bimetallic sheets and washers
- Welded copper- and aluminium-components
- Turned and milled parts according to sample or drawing
- Standoff insulators
- Busbar supports and busbar holders
- Flexible connectors consisting out of copper braid and round stranded copper cables
- Expansion connectors consisting out of copper and aluminium foils
- Insulated supple bars
- Connection terminals for supple bars
- Screw material

## Our range of services in the field of solid part machining

We are specialized in the manufacturing of busbars and power distribution components made out of copper, aluminium or brass. In addition to precise reproducible and cost-effective production of individual parts or small series, our modern machinery also enables extremely efficient serial production or the manufacture of complex components.

Bent and punched copper or aluminium busbars up to a dimension of 200 x 20 mm

Automated punched copper or aluminium busbars up to a dimension of 200 x 15 mm

Busbars or profiles out of copper bent over the high edge

Torsion bent copper bars up to a width of 100 mm and a thickness of 10 mm

3D bent busbars up to a width of 100 mm and a thickness of 10 mm

Edged large busbars or angles in a width of > 200 mm up to ca. 1000 mm and in strengths up to ca. 35 mm

Many years of experience in the design and development of individual solutions for the high-current sector offer our customers the best possibilities for the efficient and cost-effective production of components and assemblies. In addition to the stamped and bent parts, we offer turned and milled parts or welded or soldered components too.

Water cooled power pipes

Water cooled busbars in different designs

Milled parts

## Busbar systems

We design and manufacture busbar systems made of copper and aluminium bars individually adapted to the respective application. Whether for new constructions, conversions or extensions of older plants, we supply complete systems including busbar supports, flexible connections and even the complete screw- and installation material. Even currents of several thousands amperes with correspondingly large busbar cross-sections are no problem for us. The design is carried out on CAD-systems and the subsequent production on modern machines with varying degrees of automation.

If the corresponding 3D-data is available, 90-95 % of the busbar system can be prefabricated in our company and delivered directly to the construction site with all the necessary installation accessories. This considerably shortens necessary assembly times on site, which can reduce costs, especially since the production of components in the factory is much cheaper than machining them on site. On request, we can also provide personal to supervise the installation or carry out installation work with our own personal.

## Manufacture of complex curved busbars

We have equipment and bending techniques, which enable the production of copper bars with complicated bending shapes, e.g. torsion bending, bending over the high edge, production of 3D-busbars or bending of copper bars with large cross-sections > 200 mm bar width up to approx. 1000 mm and approx. 35 mm thickness.

### Torsion bending

By means of torsion bending, the connection level can be changed without any problems even when working with solid busbars

### Bending over the high edge

Bending of copper bars of different widths and thicknesses over the high edge

### 3D-busbars

3-dimensional bent busbars are produced by a combination of torsion- and bending over the high edge. They reduce the number of screw connections and thus the electrical contact resistances, the assembly time and the amount of material required (Savings in copper weight compared to a comparable screwed design). Consequently, fewer bolting points in the systems also need to be maintained.

For torsion bending or the production of 3D-busbars, standard tools are available for bar widths of 50/60/80 and 100 mm and 10 mm thickness. Production tools for other bar widths or thicknesses up to approx. 120 mm wide are available on request. Various bar dimensions and cross-sections are also available for bending over the high edge. Further information about dimensions, bending radii and technical possibilities are available on request.

3 busbars screwed together

All bent from one piece

## Stamped and punched copper- and aluminium bars

We supply stamped and punched busbars made of bar material in almost all technically possible shapes and designs.

From widths of 15 mm and thickness of 3 mm up to widths of 200 mm and thicknesses of 15 mm, cost effective automated production options are available for small and medium quantities as well as large series. We are also happy to support you in the construction and design of suitable components. On this catalogue page, you can see some examples that can serve as inspiration for your design or inquiry.

## Bent and punched copper- and aluminium busbars

In addition to our range of stamped parts, we are also equipped for the cost-effective production of bent and punched busbar components. We manufacture copper- and aluminium busbar components up to cross-sections of 200 x 20 mm on various machines or, alternatively, on large high-performance machines, busbar cross-sections up to approx. 1000 x 35 mm in small as well in large series.

The design is carried out exactly according to your wishes or drawings. Designs with water cooling are possible too. On request, we can also support you in the design of power supply systems and high current components. In this way, the design and manufacture of power supply systems and components can be carried out from a single source in a cooperative partnership.

## Surface plating / Insulations

On customer request, we also supply components with surface finishes such as tin-plated, nickel-plated, silver-plated etc. as well as insulation such as shrinkable tubing or others.

## Punched or edged sheet metal parts made of copper and bimetallic materials

According to your individual wishes or drawings, we manufacture smaller finished sheet metal parts made of copper up to 5 mm or bimetallic sheets up to 2 mm thickness. Designs with surface finishing or soldered contact parts are also available on request. Here you can see some samples:

## Things to know about joining copper to aluminium-components

Bare, uncoated copper bars often have to be connected to uncoated aluminium bars or components. According to the electrochemical voltage series however, various conductively connected metals that are jointly wetted by liquids, such as water or acids, form an electrolytic element that leads to corrosion.

The greater the voltage differences, the greater the destruction. Aluminium in eight place and copper in twenty-third place in the electrochemical voltage series are subject to a strong risk of corrosion due to the relatively large voltage difference.

**The wide range of druseidt-products includes the supply of complete Bimetallic-sheets, -cut offs and -washers, which can be used as a shim when joining copper and aluminium components.**

### Bimetallic sheets

Bimetallic sheets consist of copper clad aluminium sheets in a 70/30 ratio (70 % aluminium and 30 % copper). Since the joint between the two metals is located inside the sheets, air and moisture cannot enter. With this material, as an intermediate layer, a contact-safe and corrosion-protected connection of copper and aluminium is possible. In addition to the Bimetallic sheets and washers, we also supply cut offs with and without holes suitable for your applications.

## Welded and soldered copper and aluminium components

We are specialized in the production of welded or soldered high-current components made out of copper and aluminium materials. This production area is supported by our design department and our various machining departments who are specialized in non-ferrous metal processing too.

In close dialogue with our customers, we can develop suitable components and solutions for high-current transfer. For example, in combination with our production of flexible connections it is also possible to manufacture welded or soldered components with movable connection part or expansion compensation.

## Milled and turned components made of non-ferrous metals

We design and manufacture high-current components made out of non-ferrous metals. We produce a wide variety of components cost-effectively on modern turning, milling and drilling machines. Depending on the complexity and quantity of the work pieces, production takes place on three- or five-axis machines with varying degrees of automation.

We attach great importance to a maximum of quality and reproducibility of the processes. The manufacturing processes are supported by modern CAD/CAM-technology. We can realize both the manufacturing of individual parts and deliver at short notice.

## Perforated and unperforated busbars according to customers specifications

We supply and manufacture busbars made of copper, aluminium or aluminium alloys in both, unperforated or perforated design. Perforated busbars allow vertical connection between busbars of the same and different cross-sections as well as insulated supple bars, flexible connectors, ready made cables etc. without additional drilling. This enables a time-saving professional installation even for already existing systems.

### Deliverable designs:

- Width 15-200 mm
- thickness 3-15 mm
- length up to 4 m
- with round or slot holes
- optional with rounded edges
- with or without threaded holes

or according to your requirements  
also made out of AL 99,5 / AL MgSi 0,5/AL MgSi 1 etc.

### Timesaving installation when connecting:

- busbars which have the same dimensions
- busbars which have different dimensions
- busbars with insulated supple bars
- busbars with flexible connectors
- busbars with readymade cables

With hole pattern according to your wishes or drawings on request. We deliver individual items as well as small or bigger series according to your instructions.

### Possible designs:

- Type I round holes on one side
- Type II round holes on both sides
- Type III 2 slot holes at the beginning and the end of the bar, rest round holes
- Type IV slot holes on both sides
- Type V without holes

The slot holes are at the beginning and at the end of the busbar. All others are round holes.

### Table for the current load of copper- and aluminium busbars acc. to DIN 43671 and 43670

Continuous currents for busbars Cu-ETP/E-Cu and aluminium busbars according to the DIN regulations for rectangular bars in interior systems at + 35° C air temperature and + 65° C bar temperature and vertical bar position. Values for a changed ambient temperature and reducing factors for changed applications are contained in the DIN 43671 or 43670 respectively in the correction factor diagram K2. Supported by the correction factor K2 it is possible to correct the current load acc. to the following table to a changed ambient- and bar-temperature. All values for the current load based on the conditions of an unmoved ambient air, uncoated bars, partial oxidized, so that the emission ratio is 0,35 by aluminum, 0,4 by copper resp. 0,9 when working with painted bars. Under changed or other conditions, please take notice to the values of the norms.

## Earth and neutral busbars

We manufacture and deliver earth and neutral busbars consisting out of copper or brass with coated as well as uncoated surfaces.

Our standardized delivery program is completed by the manufacturing of designs according to clients wishes or drawings. We deliver busbars up to a length of ca. 4 m with special hole pattern, threads or special coatings.

### Punched E-Copper-bars in customized design

We manufacture punched E-Copper bars with and without screw threads beginning in a width from 15 mm and a thickness of 3 mm with coated or uncoated surfaces. We deliver bars coordinated with your application whether with round or slot holes, or with a hole combination of round and slot holes in different dimensions. Additionally to the delivery of mass produced articles we deliver individual items shortly and to a favourable price.

### Earth and neutral busbars

## Busbar supports

type tested acc. to DIN EN 61439 (VDE 0660-600-1) 2012-06 resp. 61439:2011  
operating voltage 1 kV AC, temperature range - 40° C up to + 130° C

Busbar supports made out of glass fibre reinforced unsaturated polyester (UP) similar to DIN 16911 Type 803. Free of halogen, in light grey colour. Three-phase supports, phasing-distance 100 mm (Part-No. 15645) resp. 125 mm (Part-No. 15646). Two-phase supports with a phasing-distance of 70 mm (Part-No. 15647) suitable for N- and PE-bars The supports offer a vertical clamping of busbars with a thickness of 5 mm or 10 mm resp. 10 mm or 12,7 mm (1/2"). The adjustment of the height can be regulated by the length of the distance bushings.

### Technical data

Deformation resistance	ISO 75	+ 250° C

160 x 10	2700 A	4350 A	-

All values in acc. with DIN 43671 by an ambient temperature of + 35° C and a busbar temperature of + 75° C.

## Busbar supports

operating voltage 1 kV AC, temperature range - 40° C up to + 130° C

### Part-No. 15646

#### Busbar supports, phasing-distance 125 mm

For three busbars with a thickness of 10 mm or two busbars with a thickness of 12,7 mm (1/2") per phase. The values for the short-circuit-strength and the necessary support distances are listed on page 46.

### Part-No. 15639

#### Distance bushings length 1 m in paper laminate.

#### Current load

AC up to 60 Hz

All values in acc. with DIN 43671 by an ambient temperature of + 35° C and a busbar temperature of + 75° C.

### Part-No. 15647

#### Busbar supports, phasing-distance 70 mm for N + PE bars

Suitable for 2 busbars with a thickness of 10 mm or 3 busbars with a thickness of 5 mm per phase.

### Part-No. 15539

#### Distance bushings length 1 m in paper laminate.

## Busbar holders

**clamping version for vertical busbar guide**  
suitable for mounting on insulators

Busbar holders for clamping one or two shorter busbars which should be firmly clamped in the holder in a vertical position.

**Type A:** Suitable for aluminium-bars.  
Material of the holder Al MgSi 1,0.  
Fastening material stainless-steel

**Type B:** Suitable for copper-bars  
or outdoor installations.  
Material of the holder Al Mg Si 1,0 with coated  
surface. Fastening material stainless-steel.

Deliverable threaded reducing-nipples  
made out of stainless-steel:

Part-No.

**Note:**

Dimensions in the table for busbar thickness 10 mm. For thinner busbars the dimension L is reduced. The then valid dimensions are available on request when specifying the changed busbar thickness.

## Busbar holders

**sliding version** for vertical busbar guide  
suitable for mounting on insulators

Busbar holders for clamping one or two longer busbars which, because of the heat expansion, must stand in a sliding vertical position in the holder. In this version, the upper clamping piece therefore does not rest on the busbar but on the bolt. Simple and time saving assembly option as the stud bolts can be screwed onto the insulator prior to assembly, making it possible to simply insert the busbar during assembly.

**Type A:** Suitable for aluminium-bars.  
Material of the holder Al MgSi 1,0.  
Fastening material stainless-steel.

**Type B:** Suitable for copper-bars  
or outdoor installations.  
Material of the holder Al MgSi 1,0  
with coated surface.  
Fastening material stainless-steel.

## Standoff insulators

made out of polyester resin material

with double hexagon spanner flats and threaded steel inserts

Insulators made of glass-fibre reinforced polyester resin suitable for indoor applications. They are characterized by their assembly-friendly double hexagonal design. For this reason, both the upper and the lower part of the insulator have a hexagonal spanner flat, which are arranged offset to each other. It is therefore possible to install and remove the insulators quickly and safely, even in confined spaces. In terms of costs, this reduces the assembly effort to a minimum.

Testing procedure of breaking strength

### Technical data of the material

• Density	DIN 53479	1,75 g/cm <sup>3</sup>

## Standoff insulators

made out of polyester resin material

with single hexagon spanner flat and threaded steel inserts

Standoff insulators manufactured out of a glass fibre reinforced polyester resin suitable for indoor applications. The characteristic of the material is in accordance with DIN Type 803. The compound is free of halogen with an excellent behaviour in case of fire (UL 94 V-0) and a very good strength of shape.

### Technical data of the material

- Strength of shape ISO 75 > 250° C
- Behaviour in case of fire UL 94 Class V-0 at 3,2 mm
- Density ISO 1183 1,75 g/cm<sup>3</sup>
- Special throughout resistance IEC 60093 10<sup>15</sup> Ohm
- Dielectric strength IEC 60243 20 kV/mm
- Deposit tracking IEC 60112 CTI 600
- Colour brown
- Temperature range - 40° C up to + 130° C

Part-No. 06135 Cylindrical design without spanner flat

SW = wrench size  
 T = usable thread depth  
 F = rated load limit on upper insulator edge

PWS = testing voltage (AC)  
 Z = tensile force  
 D = compressive force

Md/Nm = permissible tightening torque  
 BWS = operating voltage

## Standoff insulators made out of Polyamide

with single hexagon spanner flat and steel inserts

Standoff insulators manufactured out of reinforced, flame protected and heat stabilized Polyamide suitable for indoor applications. The compound is free of halogen and Phosphor. The material can be converted efficiently and is characterized by his excellent values for tensile strength (Z) and the rated load limit on the upper insulator edge (F). The differences to the design made out of glass fibre reinforced polyester resin are basically in the values for the behaviour in case of fire (class V2 to V-0) and the temperature range - 25° C up to + 120° C to - 40° C up to + 130° C.

### Technical data of the material

### Highly flexible power connections made out of copper braids or round stranded copper cables

Extensive technical possibilities for special solutions:

- extremely flexible components
- both consisting out of braided copper tapes as well as round stranded copper cables
- optionally made of uncoated or tinned wires
- optionally with or without insulation
- on request with coated contact areas
- in connection widths from 20 mm up to 200 mm
- in cross-sections from 25 up to 6000 mm<sup>2</sup>

### Flexible connectors made out of copper- or aluminium foils

- as expansion connector
- with application - specific adapted connection areas and shapes
- also available with tin- or silver-plated surfaces on request
- also in extruded design as insulated supple bars

## Flexible power connections

Flexible power connections are used within a busbar system to compensate for dimensional differences and thermal expansions. Additionally they are used as electrical connections between transformers, generators and switchgears with the busbar system. In this way vibrations or switching shocks can also be compensated for in addition to dimensional difference compensation. Such flexible connections can be manufactured as highly flexible current connectors made out of flat or round strands or as flexible foil connectors made of layered foils.

Highly flexible stranded connectors allow a 3D-movement but have a slightly larger installation volume than comparable foil connectors. Foil connectors are not so flexible as the highly flexible stranded connectors and have only a 2-dimensional limited mobility. However, they only require a relatively small installation space and are often cheaper to produce. All designs can be modified in terms of cross-sections and connection widths. They can also be supplied with insulation adapted to the respective installation situation.

## Highly flexible stranded connectors

druseidt stranded connectors are extremely flexible components made of flat or round E-copper/Copper-ETP strands with a single wire diameter of 0,07 or 0,10 mm. Due to the use of wires with this small single wire diameter as well as the construction of different layers of flat stranded tapes, druseidt power connectors are characterized not only by their high flexibility but also by a very large conductor surface. They thus enable the production of electrical connections with high current capacity. Seamless E-Copper/Copper-ETP sleeves are solderless crimped at the ends under high pressure.

The special druseidt-crimp technology enables a high degree of compression and forming and thus the production of extremely compacted contact areas. In this process, the entire contact surface is pressed compactly over a large area together with the strands. Due to the very high pressure during the crimping process, which amounts to several hundred tons of pressure, depending on the size of the contact surfaces and in conjunction with the process technology, developed by druseidt, the air components are pressed out of the spaces between the individual wires to such an extent that components with extremely favourable and optimized electrical contact- and connection resistances are produced.

## Flexible foil connectors

druseidt foil connectors consist of a number of layers of copper or aluminium foils with thickness e.g. 0,2 or 0,3 mm. Various manufacturing processes are available for the production, shaping and design of the connection areas. The connection areas of standard expansion connectors made of copper are produced in a press-welded design. Pressure welding is a special resistance welding process that enables entire surfaces to be welded compactly and safely without the use of any kind of other welding additives. The heating during the welding process is generated by means of current and the material of the copper connectors, which represents a resistance. The individual foils of the workpiece are then jointed together in the connection area under pressure.

The welded connection will be realized by diffusion processes (so-called grain diffusion, i.e. intergrowth of the crystals of adjacent foils) when the foils of the heated workpiece are deformed and pressed together so that a perfect molecular structure of the contact area is created. The middle expansion part of the connector still remains flexible. The pressure welding process cannot be used for aluminium connectors, foil connectors with contact areas of different widths on both sides or larger angled contact areas. Such connectors are manufactured by means of inert gas welded and welded-on solid contact pieces. These processes can also be used to weld clamping devices, suitable for connection to pipes or round bolts, to flexible foil expansion parts.

## We manufacture flexible power connections coordinated to the individual application case

We manufacture flexible connectors from the smallest ground strap up to cross-sections of several thousands mm<sup>2</sup> in air- and water-cooled design. The braided tapes and round stranded ropes, used as base material for our connectors, are also manufactured in our company and are available in rolls or spools by the metre too.

Detailed information about this product range can be found in our special catalogue no. 2 "Highly flexible air- and water-cooled connectors and cables for Hi-tech applications", which we will be happy to send you on request.

## Highly flexible copper connectors

in solderless pressed design

braided  
connectors  
non insulated

braided  
connectors  
with standard PVC-insulation

braided  
connectors  
PVC insulated and liquid protected

### Standard design

Uncoated E-Copper braid, highly flexible (wire Ø 0,07/0,10 mm) with solderless pressed contact areas made out of uncoated, seamless E-Copper/Copper-ETP tubes.

### Contact areas

Contact areas rectangular with bending protection (standard). Without or bending protection only on one side on request. It is also possible to change the lengths and the widths of all contact areas. In special design we deliver connectors with contact area width 140/150/160/180 and 200 mm too.

### Drilling

Standard design without drilling. Drilling on request according to druseidt-type I-III or customer requirements.

### Lengths

Individual acc. to customer requirements.

### Insulation

Insulated design on request. Standard material is a PVC-hose. Materials like silicone, glass-fibre- or shrinking tubes etc. on request.

### Liquid protected design

Additional liquid protected design on request.

### Special designs

In special design we deliver also connectors made out of tinned wires or with coated contact areas (tin-, nickel-, silver- or gold plated) or in coordination with your application according to your drawings/samples or wishes.

### When placing an order please specify

- druseidt-Part-No.
- total length
- If drilling is needed either druseidt-design I-III or acc. to your drawings or sketches.
- If insulation hoses are needed please add the word insulated behind the part-no. If you need another insulation material like PVC please specify this in your order.
- If you need an additional protection against liquids please add the remark with liquid protection.
- If connections with surface coated contact areas are required, please specify (type of coating and possibly desired layer thicknesses)

## Highly flexible copper connectors in solderless pressed design 25-4500 mm<sup>2</sup>

### Technical data

**Braids:**

- made out of annealed Cu-ETP1-wires
- soft annealed
- uncoated surface is standard
- tinned surface on request
- wire- $\varnothing$  0,10 mm

**Contact areas:**

- seamless Cu-ETP-tube
- uncoated surface is standard
- tin-, nickel-, silver-coated surface on request

**Insulation:**

- PVC-hose (standard)
- Silicone-, glass-fibre-, shrinking tubes or others on request

**Remark:**

All information about current-load are approximate values for single laying of air cooled cables and ambient temperature + 35° C and a conductor temperature of circa + 70° C. The temperature of the conductor is in dependent on the installation, the application, the cooling, the ambient temperature etc. so that if necessary reducing factors are to be considered. The reducing factor for an insulated design depending on the application is between 15-20 %.

## Air cooled high current cables made out of stranded copper cables

with and without insulation,  
in solderless pressed design

### Type A

### Type C

### Standard design

Manufactured out of highly flexible round stranded copper cables with bare wires, wire-Ø 0,10 mm (standard) or 0,30 mm on request. With solderless pressed contact areas made out of uncoated, seamless E-Copper/copper-ETP tubes.

### Contact areas

Contact areas shaped like a cable lug, so that two cables can also be mounted against each other on one connection bar.

### Drillings

Standard drilling according to type A or C or according to your wishes.

### Lengths

According to your wishes.

### Insulation

Standard insulation material is a PVC-hose. Other materials like silicone, glass-fibre or shrinking tubes etc. on request.

### Special designs

In special design we deliver also connectors made out of tinned wires or with coated contact areas (tin-, nickel-, silver- or gold plated) or in coordination with your application according to your drawings, samples or wishes.

### Remark:

All information about current-load are approximate values for single laying of air cooled cables and ambient temperature + 35° C and a conductor temperature of circa + 70° C. The temperature of the conductor is in dependent on the installation, the application, the cooling, the ambient temperature etc. so that if necessary reducing factors are to be considered. The reducing factor for an insulated design depending on the application is between 15-20 %.

## Flexible expansion connectors

Material: copper HCP-foils

Contact areas: press welded

Expansion connectors in standard design. The width and the thickness of the contact areas are in coordination with the usual dimensions of the traditional busbar systems. With drilling on request, e.g. according to DIN 43673 page 1 + 2, DIN 46206 page 2 or according to your drawings/samples or wishes. On request it is also possible to deliver expansion connectors with other dimensions or in bended design according to your drawings as well as with coated contact areas (e.g. tinned or silvered).

## Flexible transformer connections with expansion part

For the connection of transformers with outlets as round bolts or tubes we manufacture flexible connections made with expansion compensation part and welded clamping device. They are also available for power ratings of several thousand amperes per connection, e.g. for power transformers inside of steel melting plants and similar application. The connections are dimensionally designed individually for the transformer and can be supplied either with a clamp on one side and flat connection (for connections to busbar systems or contact plates) or with a clamping device on both sides for connections to pipe systems. Depending on the capacity and the required cross-section, the upper and lower parts of the clamping device can be equipped with a flexible expansion part. It is also possible to combine the upper part with a flexible expansion part and the lower part only as a loose clamping piece.

## PVC-insulated supple bars

Material: Cu-ETP uncoated or tinned

insulated by a black vinyl compound in lengths á 2 m

### Construction and application

Supple bars are insulated flat electrical conductors. They consist of several layers of uncoated or tin plated Cu-ETP strips (99,9 % copper) and are insulated with a flexible high quality vinyl compound.

This special compound is self-extinguishing and free of lead. The flexibility of the bars offers an installation into difficult equipment or small places.

They have become particularly well established as connectors in switchgears and between transformers, generators, switching devices and pre-fabricated power systems up to an operating voltage of 1 kV. As a consequence of their large surface area and their favorable thermal radiation properties, they transmit larger current loads than solid busbars of the same cross-section. So it is possible to use components with smaller dimensions. The elasticity of the vinyl compound realizes a deforming of busbars also when working with larger cross-sections.

By bending and twisting it is also possible to change the connection level in a minimum of space.

Our supple bars enable an individual fitting of the components, a reduction of the cross-section and a reduction of the installation time. So they are a very interesting cost-saving product.

### Technical data

#### Electrical conductor:

- copper strips Cu-ETP (99,9 % copper)
- surface uncoated or tinned
- stability  $> = 200 \text{ N/mm}^2$
- electrical conductivity  $57 \text{ S x m/mm}^2$

#### Insulation:

- special vinyl compound
- black, free of lead
- thickness 1,8-2 mm
- self-extinguishing acc. to UL 94 V0
- shore hardness 85 A
- elasticity 365 %
- AC voltage between potential and insulating material 16,5 kV
- AC voltage between two insulated supple bars in contact 33 kV
- operating voltage max. 1 kV
- operating temperature  $-20^\circ \text{ C}$  up to  $+105^\circ \text{ C}$

#### Delivery lengths:

- standard lengths 2 m
- other lengths e.g. 3 m on request

### Supple bars with halogen-free insulation on request

### Installation

Simple mounting by drilling, punching or underside clamping. The copper strips are sliding when bending the bars, therefore it is necessary to bend the bars before starting the cutting, drilling or punching process.

To prevent a displacement of the copper strips a tightly clamping of the bars is necessary too when carrying out the drilling or punching process.

**Remark:**

Stocked standard design bare and the \* marked tinned designs. In special design all dimensions are deliverable with a tin coated surface and in variable lengths (e.g. 3 m). All information about current load are approximate values in consideration of the heat for single laying of air cooled bars and ambient temperature + 35° C.

The temperature of the conductor is in dependent on the installation, the application, the cooling, the ambient temperature etc., so that if necessary reducing factors are to be considered. With pleasure our employees assist your company in finding optimal solutions.

## Finished machined supple bars/drawing components

As more and more switchgear and power transmission devices come onto the market in more compact designs, laminated supple bars offer an extremely inexpensive and space-saving way of making power connections within power transmission systems. Due to the different bending technologies available in our company, we can also produce extremely deformed, finished laminated supple bars bent, perforated, drilled according to customer requirements or drawings. We manufacture individual parts and smaller quantities as well as series parts with continuous deliveries at short notice. Here are a few examples of our diverse bending options.

## Bus- and supple bar connectors

Part-No.	Technical data				
	dimensions mm				weight kg/pcs.
	compartment L x B	outer dimension L x B	screws	torque	
02220	18 x 18	35 x 39	M 6 x 25	6 Nm	11,00

18275	M10	10,2	100
18280	M12	12,2	100
18285	M16	16,2	100
18290	M20	20,2	50

**Note:** If desired, also available in stainless-steel A4.

### Serrated washers DIN 6798

Material: bronze

Part-No.	Technical data		
	for bolt	hole-Ø mm	package unit/pcs.
18300	M 3	3,2	500
18305	M 4	4,3	500
18310	M 5	5,3	500
18315	M 6	6,4	500
18320	M 8	8,4	500
18325	M10	10,5	100
18330	M12	12,5	100
18335	M16	18,5	100

**Note:** If desired, also available in stainless-steel A4.

### Insulating grommets

Material: epoxy glass hard resin

Part-No.	Technical data					
	for bolt	L	D	dimensions mm		
			D <sub>1</sub>	D <sub>2</sub>	S	
53450	M 8	32	20	14	9	4
53455	M10	32	23	16	11	4
53460	M12	34	25	18	13	6
53465	M16	32	32	22	17	6
53470	M20	38	38	27	21	8

**Note:** These insulating grommets are used for insulating fastening bolts from the tank or other metal parts, e.g. for contact block fastening. The material epoxy glass hard resin is well suited in terms of temperature resistance as well as its resistance to pressure as, e.g. in the use of electroplating plants.

## Technical appendix

### Selecting an safety instructions by using our current transmission elements

#### General advice

The measurements and technical information written in this catalogue have been determined with greatest care and updated continuously in our documentation. We reserve us the right to make technical as well as changes of measurements, colours or formats after print. Our information especially the values for possible current loads are not binding, they are only approximate values under optimized conditions. The relation between conductor cross-section and current load fixed in national or international regulations are not cancelled through our information. Also it is necessary to pay attention to the following facts. Only the values in our written order confirmations are binding for us.

#### Demands to current transfer elements

All components for current transfer must be selected under the condition that by using the components in accordance with the regulations or requirements no unacceptable risk are created for life and health of persons as well as a damaging of objects. To guarantee these demands it is absolutely necessary to check and analyze possible risks, source of errors and rest risks even when planning or designing plants or products. All components for current transfer must be so calculated that they are sufficient dimensioned for all possible load (current as well as voltage) which can be occurred inside of the planed application. Particularly by existing limit conditions it is necessary to take the values of the current rates or voltages fixed in national or international regulations into consideration.

#### Values of influence

Following some short examinations of the fundamental facts, which have an influence of the construction of current transfer components. Please notice that it is important to consider and observe all facts together and not separately.

#### Selecting information

The fundamental facts for selecting the right current transfer components are the operating conditions and the outer influences. Operating conditions are the height of voltage and current, kinds of laying, the number of cables, the cooling possibilities, the safety devices etc. Outer influences are the ambient temperature, the existence of corrosive or other chemical substances, mechanical stress or special requirements concerning of the installation situation, the existence and influence of steam, moisture or radiation (e.g. sunlight). All these facts must be taken into account when constructing or designing solutions for current transfer applications.

#### Voltage

It is necessary to protect and insulate the flexible cables and current transfer components in coordination with the existing voltage of the application. The operation voltage of cables is defined in Volt by the values  $U_0/U$ . It is the voltage which determines the construction and the electrical test procedures of the cables. Here is

$U_0$  = Value of the permissible voltage between an external conductor and earth  
 $U$  = Value of the permissible voltage between two external conductors of multicore or a system of single core cables.

According to the regulations of the VDE 0298 part 3 the operating voltage of the cables must be identical with the operating voltage of the whole system, when working with AC-voltage. This regulation is binding for the value  $U_0$  as well as for the value  $U$ . When working in a system with DC-voltage it is acc. to the VDE allowed to calculate with a maximum value of one and a half of the operating voltage of the cables. But we recommend to exceed the value not more than 10 % continuously.

#### Current load

The cross-section of a conductor should be so selected that its allowed current-load and the permissible maximum continuous load of the application should be identical or greater. Additionally you have to take the permissible heat resistance of the used insulation material and the possible voltage drops into your account. Some fundamental facts which have influence of the dimensioning of electrical conductors are therefore:

- Kind of laying and number of the conductors
- Voltage drop and electrical losses
- Ambient temperature
- Insulation material and thermal stress
- Cooling possibilities
- Frequency of the current (when > 50 Hz)
- Consequences of electrical waves etc.

Such influences must be compensated by the consideration of necessary reducing factors. Additionally all thermal influences must be taken into account, so that it is not possible to hinder a thermal radiation and a danger of fire is excluded.

#### Mechanical stress

Also it is necessary to calculate the risk of a possible mechanical stress. Fundamental values can be created by a tensile-, pressure-, torsion- and bending stress or other facts created by the handling, transport or installation. Electrical elements which are particularly subjects of mechanical stress or flexible components which have to realize movements must be selected very carefully and well suited to the application. With pleasure our employees assist your efforts in finding optimized solutions.

#### Coordination of components to the different applications

When selecting flexible cables or components it is necessary to pay attention to the application, the installation, the ambient conditions and to all risks arising out of these facts. So a consideration of the following facts is important too:

- Avoidance of a possible mechanical or electrical influence between bordered power systems
- Thermal radiation as well as chemical or physical influences of the conductor, the insulation or other bordered materials
- Examination of possible influences or reactions between bordered materials and the conductor with his insulation
- Examination of the fixing and the fixing materials concerning possible damages e.g. caused by the dynamic strength in case of short circuit situations.

#### Service and maintenance

Electrical equipment requires continuous control, maintenance and servicing. The intervals and activities to be carried out depend on the individual conditions of use and the applicable legal regulations. Pay particular attention to soiling and damaged components. For the execution of screw connections, we recommend that the guidelines for DIN 43673 part 1 busbars, busbar drill holes and – screw connections be taken into account. When screwing copper to aluminium components, bimetallic material should be used as an intermediate layer (see also our information on catalogue pages 14 + 15). We will be happy to send you detailed screw connection recommendations for flexible or high current connectors and busbars on request or advise you on your applications.

Values in acc. with DIN 43671 by + 35° C air- and + 75° C busbar temperature.

Data refer to the use of copper (Rp 0,2) with a strength of 300 N/mm<sup>2</sup>.

lcw = Rated short-time withstand current.

lpk = Rated impulse withstand current.
